

# IPVLive plug-in streams into Adobe Premiere Pro

The IPV Curator production asset management and SpectreView streaming proxy solution is seamlessly integrated within Premiere Pro through the 'IPVLive' plug-in. Live event and archive material is instantly transcoded into IPV's broadcast standard, timecode accurate, production proxy format and streamed directly into Premiere Pro to take advantage of Adobe's advanced editing capabilities while the video is in record.

## Adobe Premiere Pro with IPVLive plug-in

### Key Features

- Advanced offline editing with true streaming proxies
- Centralised single copy of media
- Instant live access
- Network bandwidth efficient
- Increased security of assets
- Reduced infrastructure costs
- Live remote access
- Future proofing for standards change
- Automated multi-source publishing of high resolution media
- Automation of advanced broadcast workflows

### Uses

- Fast turnaround – News and Sports
- Highlight and Promo packages
- Archive management
- Compliance editing
- Versioning
- Censorship

Multi-user collaborative projects can be accessed over standard IT networks giving journalists and production personnel unprecedented freedom and greatly reduce the time and storage needed to move high resolution assets around.

Curator maintains a low bit-rate copy of all of your assets and tracks the high resolution media whether online, nearline or offline through a catalogue of associated metadata. The 'IPVLive' plug-in exposes this directly within

the Premiere Pro interface to provide a seamless editing experience for the end user.

Once complete, the project's EDL can be assigned to a variety of network based, custom workflows automated by the IPV Process Engine thereby freeing up the end users time and computer to move onto the next task. The result; a secure, highly efficient streamlined workflow designed for the busiest of production environments.
